

Weight Reduction Continues With “202” Ends

Aluminum cans are getting lighter! And, one reason is because their ends are getting smaller. You can tell by comparing the size and weight of can ends introduced throughout the years.

Size	Weight (including the tab)
206	8.12 pounds per thousand
204	6.67 pounds per thousand
202	6.07 pounds per thousand

All sizes of can ends are still in use today, although very few of the “206” size can be found. And, remember, even though the ends are smaller, aluminum cans still hold the same amount of drink as they always have — 12 ounces.

What’s your end size? Match your aluminum beverage can’s end to these and find out.

My Aluminum Beverage Can End Size is _____!
